-

1. Empire Dashboard

- **What it is:** The central control hub and main home screen for the player's account.
- **Information it extracts:** The player's current progression level, installed factories, factory tiers, and primary account balances.
- **What it calculates/shows:** A consolidated overview of the estimated total daily yield and performance metrics across the entire base.
- **Player benefit:** Removes the need to log into the game and click every single factory manually; players get a bird's-eye view of their empire instantly.

2. Grid Land Scanner (Matrix)

- **What it is:** A 2D interactive visual map grid of the player's base.

- **Information it extracts:** The exact coordinates (X and Y positions) of every single structure placed on the land, including factories, crops, expansions, and clearing obstacles.
- **What it calculates/shows:** Total spatial distribution, optimized setups, and remaining free build space.
- **Player benefit:** Allows players to meticulously plan their base layouts to eliminate wasted tile spaces, making land expansion management incredibly efficient.

3. Live Production Countdowns (Factory Timers)

- **What it is:** A real-time tracking panel displaying live countdowns for ongoing tasks.
- **Information it extracts:** Which factories are actively running, what specific recipe or item they are crafting, and the exact timestamp when the production cycle started.
- **What it calculates:** The precise second when each resource will finish crafting, updating live progress bars and timers.
- **Player benefit:** Eliminates dead time. Players know exactly when to jump back into the game to collect finished products and start the next queue, maximizing their hourly output.

4. Recipe Optimization (Profitability)

- **What it is:** A personal financial analyst for the game's economy.
- **Information it extracts:** In-game crafting recipe sheets and live item market prices.
- **What it calculates:** Cross-references raw ingredient costs against the final product's market value, calculating the exact net profit margin or loss per crafting cycle.
- **Player benefit:** Tells the player exactly which items are highly lucrative to craft right now and which ones are a waste of resources (showing when it is cheaper to buy an item directly from the market rather than crafting it).

5. Net Worth Evaluator (Inventory Value)

- **What it is:** A wealth and inventory liquid-value counter.

- **Information it extracts:** Every single resource, item, and token currently sitting in the player's chests, backpack, or bank vault.
- **What it calculates:** Multiplies the exact quantity of each stored resource by its active market price to display the absolute total net worth of the inventory in coins.
- **Player benefit:** Shows players their true financial standing, making it clear which accumulated items are hoarding the most value and should be liquidated for fast cash.

6. Smart Investment Guide (Upgrade Advisor)

- **What it is:** A data-driven strategic advisor for upgrading structures.
- **Information it extracts:** Current levels of built factories and the player's hoarded upgrade materials.
- **What it calculates:** The total cost to tier-up a factory compared to the production speed or yield boost it will provide, calculating the exact **Return on Investment (ROI)**.
- **Player benefit:** Takes away all the upgrade guesswork. It tells the player mathematically: *"Upgrade your Copper Factory first because it pays for itself in 2 days, whereas upgrading your Steel Factory will take 2 weeks to break even."*

7. Crafting Tree Architect (Resource Planner)

- **What it is:** A logistical preparation tool for high-tier crafting goals.
- **Information it extracts:** Complex, multi-tiered crafting recipe chains.
- **What it calculates:** When a player inputs a target goal (e.g., "I want to make 5 Dynamites"), it calculates the exact total sum of base raw materials needed from scratch, the total energy costs, and the absolute time required across all processing steps.
- **Player benefit:** Saves the player from doing manual math with pen and paper. They know exactly what to gather before committing to massive end-game builds.

8. Industrial Comparison (Factory Compare)

- **What it is:** A side-by-side industrial performance analyzer.

- **Information it extracts:** Base operational costs, speeds, and output limits of different factory categories.
- **What it calculates:** Sets two different factory types face-to-face to analyze their relative energy drains, maintenance costs, speed multipliers, and projected net profits per hour.
- **Player benefit:** Helps players make long-term macro-strategy decisions regarding which industrial infrastructure path is most worth building on their properties.

9. Market Ticker & Charts (Prices)

- **What it is:** An economic tracker focusing on the game's open marketplace.
- **Information it extracts:** Active market listings and price indexes.
- **What it calculates:** Historical price fluctuations, evaluating whether specific items are trending up or crashing over time.
- **Player benefit:** Allows players to play the market like a pro—buying materials during low-demand dips and flipping their inventory when scarcity spikes prices.
